TECHNICAL SPECIFICATIONS

1. INSTALLATION OF JOINT CLOSURE & SPLICING OF OFC:-

Fusion splicing is used for splicing the fiber in BSNL network. This is accomplished by applying localized heating (i.e., by electric arc or flame) at the interface between two butted, pre-aligned fiber ends, causing them to soften and fuse together. For this purpose fusion splicing machine is used.

There are various types of joint closures in use for BSNL, namely SJC (Straight Joint Closure) and BJC (Branch Joint Closure). The SJCs are predominantly used along the cable routes, and the BJCs are used where ever, the fiber toppings and branching of cable is required. The Procedure for assembly of joint closures is generally supplied by the manufacturers along with the joint closures. However the general procedure for assembly of joint closure is described below:

1.1 JOINTING of Optical fiber CABLE

The manufacturer's manual contains the following:

- Material inside joint closure kit.
- Installation tools required.
- Detailed procedure for cable jointing.

- d) Procedure for re-opening the closure.
- 1.2 **However, generally, the following steps are involved for jointing of the cable.**
 - a) Preparation of cable for jointing.
 - b) Stripping/cutting the cable.
 - c) Preparation of cable and joint closure for splicing.
 - d) Fiber splicing.
 - e) Organizing fibers and finishing joints.
 - f) Sealing of joint closure end.
 - g) Placing joint in pit.
 - h) Marking of cable end.
 - i) Marking of fibers in tray.

a) PREPARATION OF CABLE FOR JOINTING:-

- o During the installation, a minimum of 10 meters of cable of each end is coiled in the jointing pit to provide for jointing to be carried out at convenient location as well as spare length to be available for future use in case of failures.
- o The pit size must be chosen carefully to ensure the length of the way on which joint is mounted is greater than closure length plus twice the minimum bending radius of the cable. A pit length of 1.2 meter is sufficient for most of the cable and joint closures. Bracket to support the cable coil are also fixed on the wall of the pit.
- o The cable is then coiled on to the pit wall in the same position as required after the joint is complete. The marking is done on all the loops so that it will be easier to install it later.
- o The distance from the last centre to the end of the cable must be at least 1.8 meter. This is being the minimum to be stripped for preparation of joint.
- o Sufficient cable at each end up to the jointing vehicle/enclosure is then uncoiled from the pit for jointing.

b) STRIPPING/ CUTTING THE CABLE:

- The cable is stripped of their outer and inner sheath with each sheath, staggered approximately 10mm from the one above it.
- Proper care must be taken when removing the inner sheath, to ensure the fibers are not scratched or cut with the stripping knife or tool. To prevent this, it is best to only score the inner sheath twice on opposite sides of the cable, rather than cut completely through it. The two scores marking on either side of the cable are then stripped of the inner sheath by hand quite easily.
- The fibers are then removed from cable one by one and each fiber is cleaned individually using isopropyl solution to remove the jelly.

c) PREPARATION OF CABLE JOINT CLOSURE FOR SPLICING:

- The type of preparation work performed on the cable prior to splicing differs on the type of joint closure and fiber organizer used. However, the following steps are usually common:
- The strength member of each cable is to be fixed to the central frame of the joint.
- The sealing compound or heat shrink sleeve is applied to the cables and closure or prepared for application after splicing is complete.
- The fibers are protected (usually with plastic tubing) in their run from the cable core to the fiber organizer trays (particularly if cable construction is slotted core type). Two Nos of plastic tie shall be used to hold fiber tube with splicing tray.
- Tags which identify the fibers numbers are attached at suitable locations on the fibers.
- Splice protectors are slipped over each fiber in readiness for splicing over the bare fiber after splicing.

d) FIBER SPLICING

STRIPPING AND CLEAVING OF FIBER:

- Prior to splicing each fiber must have approximately 50mm of its primary protective U.V. cured coating removed, using fiber stripper which are manufactured to fine tolerances and only score the coating without contacting the glass fiber.
- The bare fiber is then wiped with a lint free tissue doused with ethyl alcohol.
- 1.6.3 Cleaving of the fiber is then performed to obtain as close as possible to a perfect 90 face on the fiber.

e) FUSION SPLICING OF THE FIBER:-

- Some of the general steps with full automatic micro processor control splicing machine are as under:
- Wash hands thoroughly prior to connecting this procedure.
- Place the bare fiber inside 'V' groove of the splicing machine by opening clamp handle such that the end of fiber is app.1 mm. over the end of the 'V' groove towards the electrodes.
- Repeat the same procedure for other fiber, however first insert heat shrink splice protector.
- Press the start button on the splice controller.
- The machine will pre fuse, set align both in 'X' and 'Y' direction and then finally fuse the fiber.
- Inspect the splice on monitor if provided on the fusion splicing machine and assure no nicking, bulging is there and cores appear to be adequately aligned if the splice does not visually look good repeat the above procedure.
- Slide the heat shrink protector over the splice and place in tube heater. Heat is complete when soft inn
- er layer is seen to be 'oozing' out of the ends of the outer layer of the protector.

- Repeat the same procedure for all the other fibers.

f) ORGANISING FIBER AND FINISHING JOINTS:-

- After each fiber is spliced, the heat shrink protection sleeve must be slipped over the bare fiber before any handling of fiber takes place, as uncoated fibers are very brittle and cannot withstand small radius bends without breaking.
- The fiber is then organized into its tray by coiling the fibers on each side of the protection sleeve using the full tray side to ensure the maximum radius possible for fiber coils.
- The tray is placed in the position.
- OTDR reading taken for all splices in this organized state and recorded on the test sheet to confirm that all fibers attenuation are within 0.1 db per splice. This OTDR test confirms fibers were not subjected to excessive stress during the organizing process.
- The splice loss measurement on each to fiber is also to be taken from the terminal station using power meter to determine the splice loss of each fiber < 0.1 db.
- Only after satisfactory confirmation of the splice loss within limits i.e. 0.1 db using power meter, the joint pit is to be closed with proper sealing,

g) PLACING JOINT IN PIT:-

- Joint is taken out from the vehicle and placed on the tarpaulin provided near the pit.
- The cable is laid on the ground; coil the cable such that pen mark previously placed on the cable line up. Tape these loops together at the top of the coil.
- The joint can now be permanently closed and sealed by heating heat shrinkable sleeve etc.
- If required for attending to faults etc., manufacturers supply special kits for opening of the joint and the steps to be followed. However the general steps are as under:
 - Using suitable knife cut heat shrink sleeve longitudinally along its entire length.
 - Do not damage the smaller heat shrunk sleeve on the ends of the joint.
 - Apply heat to the cut sleeve until it begins to separate.
 - Gently remove the cut sleeve from the joint. Now the joint can be opened.
 - Protective sleeve/cover can be removed for attending to faults etc.

EXCAVATION OF TRENCHES:

1. The trenches shall be excavated in various type of soil such as soft/hard soil (which yields to the ordinary application of pick and shovel or any other ordinary digging implements or close application of picks or jumpers or scarifies and ripper) hard rock (which can only be broken for excavation by blasting using explosives or by heavy breakers driven by compressors). Soft rock/murum (which may be quarried or splitter with crow bars or picks. If required light blasting may be required to loosen the materials or mixture of soil murum and/or rock mentioned above, but for the purpose of the contract a single rate meter shall be quoted irrespective of soil conditions).
2. The department does not take only responsibility for variation in site strata and/or type of the soil as mentioned in notice inviting tender. The tenderer at his own risk and cost shall make his own assessment of site strata and/or type of the soil before tendering his rate.
3. Measurement of actual depth of excavation shall be recorded in multiples of 5 cm, ignoring the fraction of 5 cm. if any.
4. Contractors shall have necessary license for use of explosives for blasting operations or shall obtain such licenses at their own cost.
5. **In locations where depth of excavation may be more/less then 165 cm.** and relaxation is sought by the contractor for any reason what so ever, the corresponding approved contracted rate will be increased/reduced by a percentage factor as demonstrated below for various blocks of depth and payment as consequence will be make on the revised reduced rate on prorated as indicated below, provided that, such depth variation has been permitted by engineer-in-charge.

For Depth less than 165 Centimeter:

	Depth of trench (in cm.)	Reduction in through rate
A	Greater than 150 but less than 165	5% (five percentage)
B	Greater than 135 but less than or Equal to 150	12.5% (twelve and half percentage)
C	Greater than 120 but less than or equal	25% (Twenty five percentage)

	to 135	
D	Greater than 100 but less than or equal to 120	40% (forty percentage)
E	Equal to below 100	40% (forty percentage)

Rate of payment =

$$\frac{100 - \text{Reduction as above in rate\%}}{100} \times \frac{\text{through rate} \times \text{depth achieved in}}{165}$$

For Depth more than 165 Centimeter:

	Depth of trench (in cm.)	Reduction in through rate
A	Greater than 165	5% (five percentage)

For example: - in a section, if there are five places viz. A,B,C & D where in contractor is permitted for the following depth at these places.

155 cm.	140 cm.	125 cm.	105 cm.
(A)	(B)	(C)	(D)

If the rate approved is Rs. 40/- for a depth of 165 cm. then the rate application per running meter at above these places will be:

A.	$\frac{(100-5) \times 40 \times 155}{100 \times 165}$	= Rs. 35.70/-
B.	$\frac{(100-12.5) \times 40 \times 140}{100 \times 165}$	= Rs. 39.70/-
C.	$\frac{(100-25) \times 40 \times 125}{100 \times 165}$	= Rs. 22.73/-
D.	$\frac{(100-40) \times 40 \times 105}{100 \times 165}$	= Rs. 15.27/-

CONSTRUCTION SPECIFICATIONS

GENERAL:

- The work shall conform to the standards prescribed in specification in case where no such specifications are mentioned in the contract, in such cases contract shall be executed in accordance with the district specification, and in the event of there being no district specification than in such case the contract shall be executed in all respect in accordance with the instructions and requirement of engineer in charge.
- The work involve excavation of trenches, laying of PLB pipes as mentioned in the scheduled jointing them and reinstatement of the excavated trenches. A nylon or polly prope line rope shall be pulled through the pipes while jointing, the ends of the PLB pipes section of normally 150 to 200 meter shall be suitably plugged to prevent mud, dirt or nay other object entering the pipes wherever necessary/GI/ RCC and GI trough shall also be laid over PLB pipes as additional protection to PLB pipes. Cement concerning shall also be provided over the protection pipes wherever necessary.

DEPTH AND SIZE OF THE TRENCH:

3. The depth of the trench from top of the surface shall not be less than 165 cm. unless otherwise permitted. The width of the trench shall be sufficient to lay the requisite number of PLB/GI/RCC pipes and also concerning wherever required. When trenches are excavated in slopes uneven ground inclined portion the lower edge shall be treated as top surface of land and depth of trench shall be measured accordingly.
4. If excavation is not possible to the minimum depth of 165 cm. full fact should be brought to the notice of the engineer in charge in writing giving details of location and reason for not able to excavate that particular portion. Approval may be granted by engineer in charge in writing under certain genuine circumstances only. The decision of engineer in charge shall be final and binding on contractor.
5. In a certain locations such as uneven ground, hilly areas ends of culverts and all other place due to any reasons what so ever it can be ordered to excavate beyond standard depth of 165 cm to keep the bed of the trench as smooth as possible.

TRENCHING:

6. Trenching shall as far as possible be kept ahead of the laying of pipes contractor shall exercise due care that the soil from trenching intended to be loose for back filling is not mixed with loose debris, the contractor shall provide sufficient width at the trench at all such places where it is likely to cave in due to soil conditions without any extra payment, in order to prevent damage to PLB pipes over a period of time due to the growth of trees, roots, bushes, etc. the contractor shall cut them if encountered in the path of alignment of trench without any additional charges.
7. While trenching the contractor shall not cause damage to any underground installations belonging to other agencies and any damage caused shall be made good at his own cost and expense. A minimum free clearance of fifteen cm. shall be maintained above or below any existing underground installations without any extra charges.
8. In large borrow pits, excavation shall be done not less than 165 cm. in depth and both sides of borrow pits shall be excavated more than 165 cm. in depth to keep gradient of bed not less than 15 degree with horizon if not possible as above alignment of trench shall be changed to avoid borrow pit completely.

LOCATION AND ALIGNMENT OF THE TRENCH:

9. In city areas the trench will normally follow the foot-path of the road except where it may have to come to the edge of the carriage way when cutting across road with specific permissions from the authorities responsible for repair of the road outside the city limits the trench will normally follow the boundary of the road side land. However, where the road side land is full of borrow pits or a for station or when the cable has to cross culverts bridges or streams, the trench may be closer to the road edge or in some cases, over the embankment or shoulder of the road (permission for such deviations for cutting the embankment as well as shoulder of the road will be obtained by the department).
10. The alignment of the trench will be decided by a responsible departmental official not below the rank of Junior Telecom. Officer with marking the alignment the centre line will be marked and the contractor shall set out all other work to ensure that, the excavated trench is as straight as possible. Contractor shall remove all bushes, undergrowth stumps, rocks and other obstacles to facilitate marking the center line without any extra charges.

DEWATERING:

11. The contractor shall be responsible for all necessary arrangements to remove or pump out water for trench the contractor should survey the soil condition encountering the sections and make his own assessment about denaturing arrangements that may be necessary no extra payment shall be admissible for this and the tendered rate may take care of this aspect.
12. In city limits as well as in built up area, the contractor shall resort to use of manual labour only to ensure no damage is caused to any under ground or surface installations belonging to other public utility service and or private parties. How ever along the high ways and cross country there shall be no objection to the contractor resorting to mechanical means of excavation provided that no under ground installation existing in the path of the excavation if any are damaged. There shall be no objection to resort to horizontal boring to bore a hole of required size and PLB pipe pushed through it at road crossing or rail crossing or small hill rocks etc. in hard rock, where blasting is not possible due to thickly population area, village house or construction nearby the trenching shall be done by means other than blasting only.

LINE-UP:

13. The line up of the trench must be such the PLB pipes shall be laid in a straight line except at location where it has to necessarily take a band because of change in the alignment or gradient of the trench, subject to the restriction mentioned else where.

LYING OF PLB PIPES:

14. After the trench is excavated to the specified depth the bottom of the trench shall be cleared of all stones or pieces of rock and leveled up property. A layer of ordinary soil of not less than five cm. shall be used for leveling the trench to ensure that PLB pipes or cable when laid will follow as straight alignment.
15. When trenches are excavated up to specified depth, properly dressed and leveled, joint measurement of trench shall be taken by representative of contractor and site engineer measurement shall be recorded in measurement book with their signature. Trenches for which measurement are recorded in measurement are recorded in measurement are recorded in measurement book shall be considered as approved trenches.
16. PLB/GI/RCC pipes shall be laid only in approved trenches. The contractor shall exercise due care to ensure that the PLB pipes is not subjected to any damage or strain. Water present in the trench at the time of laying the PLB pipes shall be pumped out by the contractor before lowering in the pipes to ensure that no mud or water gets into the pipes.
17. The PLB pipes shall be jointed by “O” ring type socket fitted with hard rubber rings at both ends. Nylon or PP rope shall be drawn though PLB pipes properly at the time of laying pipes.
18. At road crossing two or more extra PLB pipes shall be laid as per the direction of the site engineer.
19. In cross country routes, where depth of trench is loss than 120 cm. PLB pipes should be laid within GI/RCC pipes. Alternatively PLB pipes may be encased in reinforced concerts casing of dimensions 225mm X 225mm as decided by the engineer-in-charge. In built up areas where depth of trench is not less than 165 cm PLB pipes PLB pipes shall be laid within GI/RCC pipes, in case of trench depth being less than 165 cm, the PLB pipes must be encased in reinforced concert casing of dimensions 225mm X 225mm with the permission of engineer-in-charge.

20. In case of mullahs, which are dry for nine months in a year. The PLB pipes shall be laid within RCC pipes paid at a minimum depth of 165 cm. The RCC pipes shall be extended two meter beyond the bed of mullahs on either said not with standing anything contained in this clause engineer in charge may admit in any specific case that the PLB pipes may be encased in reinforced concrete casing only.
21. The following construction practices are application in general:
 - A) Wherever GI pipes are used rubber bushes shall be used at the two ends of the GI pipes to protect the damages of PLB pipes.
 - B) Wherever RCC pipes are used, two ends must be properly sealed to bar entry of rodents.

- 11.1.3 **Method of recording of nomenclature of items :** Complete nomenclature of items, as given in the agreement need not be reproduced in the measurement book for recording the measurements but corresponding Item Code as provided, shall be used.
- 11.1.4 **Method of measurements:** The measurements of the work shall be done for activity wise as and when the item of work is ready for measurement. The methods of measurement of various items are enumerated as under:
- 11.1.5 **Measurement of depth of trenches** The cable routes of one work order shall be divided into a number of segments each of maximum 100 meters length bounded by identifiable landmarks at both the ends of the segments. If landmarks are not available, length of segment may be maintained at 100 meters. The measurement of depth shall be recorded at each point of measurement (POM) in the measurement book in meters in the multiples of 5cms. For example 97 cms will be recorded as 95 cms and 103 cms as 105 cms. The points of measurements shall be at a distance of 10 meters starting from 0 (Zero) Meter. For example, if the length of segment is 175 meters, the POMs shall be at 0 M, 10M, 20M, 30M, 40M, 50M, 60M, 70M, 80M, 90M, 100M, 110M, 120M, 130M, 140M, 150M, 160M & 170M. The last POM shall be at 175th M to be recorded against Residual POM. The efforts required to excavate trenches is not proportionate especially with reference to depth. Therefore, normally the workers tend to dig shallow trenches. As standard depth of the trench is important for future life and protection of cables, this tendency has to be discouraged. In order to encourage the contractor to achieve best possible depth in the face of site constraints, the following scale of payment shall be applied for digging trenches of lesser depths, subject to condition that relaxation has been granted by the competent authority for lesser depths.

If the contractor does not meet the specification of trench as per tender term and conditions straight Rs 150/meter will be deducted from the monthly bills.

11.1.6 Measurement of lengths and protection.

The measurements of length of trenches are on running meter basis, irrespective of type of soil encountered while digging. The type of protection provided (item code-wise) in a segment shall be recorded in the measurement book in the sheet provided for this purpose.

11.1.7 Measurement of length of cable: The length of cables laid in trenches, through pipes and through ducts shall be measured by use of RODO Meter/Measuring Tape. The length should be cross verified with the marking of lengths on the cable. The lengths shall be recorded in sheet provided in the measurement book.

11.1.8 Measurement of other items. The measurement/numerical details of other items shall be recorded in the sheet provided in the measurement book for respective items viz. Digging of joint pit and preparation of joint chamber along with its type i.e. Brick chamber or Pre Cast RCC type. Fixing, Painting and sign writing of route/joint indicators, Termination of Cable in equipment room and no. of joints.

11.1.9 The contractor shall sign all the measurement recorded in the measurement book. This will be considered as an acceptance by the contractor, of measurements recorded in the MB. In case contractor fails to attend at the measurements or fails to countersign or to record the difference within a week, then in any such events the measurements taken by Engineer-in-charge or by the subordinate as the case may be shall be final and binding on the contractor and the contractor shall have no right to dispute the same.

11.1.10 The Divisional Engineer before passing the bill for **SECTION** s covered by each set of measurement may carry out test check by re-opening trench at as many locations as necessary as specified in document 'procedures for underground cable construction' and bills be passed only when he is personally satisfied of the correctness of entries in the "measurement Book" and also when he is satisfied of other aspects of the work as per the terms of the contract. The contractor shall provide the necessary assistance of labour for re-opening of trench for test check by the Divisional Engineer; Separate payment shall not be made to the contractor for excavation of such test checks; however such test pits shall not be more than 10% of the cable laying work.

11.1.11 Measurement of the work of cable pulling through pipe/duct will be taken equal to the length of the pipe/duct through which the cable has been pulled and not the total length of the cable pulled through pipe/duct.

11.2 Inspection, and Quality Control:

- a. State of the art technology shall be used. Quality control through Acceptance Test (AT) shall be done by BSNL from time to time. BSNL reserves the right to carry out sample checks. Further, the OF cables are vulnerable to damages due to work of other agencies.
- 11.2.2 The quality of O.F. cable Plant depends upon the quality of individual items of work involved viz Depth of Cables laid, care while paying & laying, Protection, Jointing of Cables and Terminations in equipment room and at last but not the least on documentation of cable network. In order to ensure quality in Cable Construction Work, each component of work needs attention. The works shall be carried out strictly in accordance with specifications laid down to achieve the requisite quality aim.
- 11.2.3 It is imperative that the contractor(s) is/are fully conversant with the construction practices and shall be fully equipped to carry out the work in accordance with the specifications. The contractor shall make test pits at the locations desired by site incharge for conducting test checks without any extra payment. The contractor shall restore the pits after test measurements to its original shape. The contractor shall be responsible to provide test/measurement tools and testers for conducting various tests.
- 11.3.2 **Scope of Acceptance and Testing :** The purpose of acceptance and testing is to verify integrity of measurement and quality of work done.
